

Advantages of Elastomeric BUR Over EPDM

1. Multi-ply Redundancy – Extra thick, multi-layers are much more forgiving of application errors.
2. Monolithic Membrane “Sandwich” – no lap or seam failures.
3. High puncture and tear resistance – will not propagate its own tear, offers extra protection against roof top traffic, maintenance operations, storm damage, vandalism, and birds.
4. Easily repaired with off-the-shelf asphalt based products.
5. Excellent Wind-Uplift Resistance
 - No flutter common with mechanically attached EPDM systems
 - High resistance to fastener backout
 - Does not require 12-20 lbs/sq ft. ballast
6. Proven through 2 decades of performance without reformulation of primary components.
7. Barrett elastomeric BUR has self-healing properties in warm weather.
8. Barrett BUR does not require toxic adhesives or sealants.
9. Barrett systems are exclusively installed by approved qualified applicators.
10. Barrett offers longer-term warranties than are available with EPDM systems.
