Ram ColdTar Design Alerts

- Ram ColdTar is compatible with all types of bitumen roofing, Coal Tar Pitch, SBS modified, APP modified, asphalt built-up roofing and SEBS roofing systems.
- Ram Cold Tar is not compatible with elasto-plastic single ply systems.
- There is a certain point when a roof requires complete removal before a replacement can be installed. Failed roofs with extensive wet insulation or deteriorated decking are not candidates for repair and renovation. Projects to be warranted must have a certified IFR survey conducted before roofing work proceeds and we strongly recommend it for all projects.
- On Gravel surface roofs, the existing loose gravel must be power broom swept and vacuumed off.
- If deck deflection has caused waterponding it is prudent for the Owner to retain an Engineer to ensure the deck is not in danger of collapse from ice, rain and snow loads.
- When the existing roof must be removed, the Barrett Company offers many economical high performance roofing options including hot or cold Elastomeric BUR systems, environmentally friendly Greenroof-Roofscapes® and time proven Ram-Tough 250 Protected Membrane Roofs.
- For ColdTar flashing treatment please see Barrett Bulletin #100.
